Mounting of MANN-FILTER air cleaners with GST

The following air cleaners for Off-Highway-applications are part of our GST (Glue String Technology) product family and are used in OEM- filter housings with metal sheet body:

C 32 1700/2 (main element)	-	CF 18 190/2 (safety element)
C 37 2070/2 (main element)	-	CF 23 430/2 (safety element)
C 37 2680/2 (main element)	-	CF 23 550/2 (safety element)

For design reasons the secondary elements have a firm cover. By mounting it leads to the impression the end position of the secondary element in the housing has already been reached, but it has not being screwed far enough. As a result, the main element cannot be screwed in far enough either and it creates the impression the main element is too long.

This can be remedied by greasing the end cover of the secondary element and the inner side of the cover main element, as it is much easier to reach the final position in the housing.

main and secondary filter element

cover secondary element and inner side main element should be greased
