Interior Light

84740121-124

LED interior light with motion and heat sensor (PIR sensor) that works up to a distance of 4 metres. The interior light is equipped with a MASTER function, thereby providing the option to connect and operate additional interior lights in series. A maximum of 4 lights (article number 84740123) or 6 lights (article number 84740122) can be connected together. The master (article number 84740121) acts as a "switch" for all other interior lights (slaves). To effectively illuminate the loading area in a commercial vehicle trailer, for example, additional interior lights are required. The interior light (master) is mounted on the ceiling near the door. As soon as the door is opened, the master switches itself on automatically while simultaneously sending a signal to all connected slaves, which are switched on immediately. When the master automatically switches itself off (timer function: 5 minutes), all the slaves are also switched off.
